MEMORANDUM FOR: Chief, Manufacturing and Services Division, ORR

ATTENTION:

Chief, CIA/PID (MPIC)

SUBJECT: Ihasa-Tsona Drong Road

(b) Project No. C 1121/62

REFERENCES : (a) Requirement No. ORR/302/62-

- 1. This memorandum is in response to the referenced requirement requesting:
- ment and condition of the road connecting thas (29 39N 91 06E) to Tsona Thong (27 59N 91 59E).
- b. Indicate any roads in the area which appear to be under construction or recently completed.
 - c. Describe any roads leading from China into India.
- 2. The Lhasa-Tsona Dzong Raod, the principal supply route into the NEFA plain from Lhasa, proceeds southwest from Lhasa along the west bank of the Gya Chu (River) through Chusul Dzong (29 23N 90 44E). Just south of Chusul Dzong the road crosses the Brahmaputra River by means of a long pontoon bridge at Chaksam Gompa (29 20N 90 42E), and proceeds eastward along the south shore of the Brahmaputra (Tsangpo) River to Tsetang (29 15N 91 46E). Here the road turns sharply southward through Dagyeling G (28 58N 91 54E), Kankang Pass (28 43N 92 05E), Tsona Dzong, and through the Fum La Pass (27 44N 91 54E), into the NEFA Plain.
- 3. The section between Ihasa and Taetang is a two lane, graded, earth surface road probably reinforced with gravel or cruched stone. The section between Taetang southward through Taona Dzong is a single-lane improved road. The width of this road widens to two-lanes for short stretches; however, it must be considered as single-lane.

- 4. The Lhasa to Tsona Dzong road appears to have most major streams bridged; however, some small streams are not bridged and the bridges that were visible appeared to be of lighter construction than those found between Ch'ang-tu and Lhasa and other main supply routes into Tibet from China.
- 5. Southwestward from Tsona Dzong, a well defined, but narrow (single-lane) road proceeds through Trimo (27 52N 91 54E) and connects with the main road at 27 26N 91 54N. This road would provide an important alternate route for the main road into the border area and; although it does have many steep grades, sharp curves, and several series of switchbacks, the road appeared well maintained.

6. Important branch roads are as follows:

- a. Chitishio (29 16N 91 10E) to Lhakhang Dz (28 04N 91 03E). This road appears to be very poor between Chitishio and Palti Tso (Lake). Eastward to Trigu Too, although there does not appear to be any improvement made to the road surface, the terrain is so level and the earth surface so smooth, that the road would have to be considered a good supply route. There are very few heavy grades, sharp curves and no switchbacks observed or this section. The road skirts the west shore of Trigu Tso (Lake), then turns southwestward to Lhaklang Dz. This section of the road follows generally in river valleys and, although it traverses very rugged terrain, the road does not have a great number of sharp curves, steep graies or switchbacks. This section of the Chitichio-Lhakhang Dz roed appears to be a much better road than the northern section. The roadbed has had considerable work and sections of this road approached two lanes in width. South of Lhakhang to the India border the road is unimproved-little better than a pack-animal trail.
- b. Another supply route proceeding into the border area from the main Lhasa to Tsona Dzong road, is a road connecting Dzgyeling G (28 58N 91 54E) with Asafilia (28 22N 93 15E). This road runs generally into river valleys, high moutainous plateaus and inter-mountain basins. There are several long stretches through mountain passes where traffic would be slowed-down and loads limited by steep grades, sharp curves and switchbacks. There is a stretch of approximately 25 miles between Sang Choling G (28 33N 93 00E), where the road shows a great deal of construction work. This 25 mile section is two-lane in width over much of its route and appears to be well maintained. This road, together with the alternate road leading from the main (Lhasa-Tsona Dzong) road provide considerable supply-potential into this border sector.
- c. All other roads are plotted on map CIA/PID/IB-P-522/63. The map legend explains the condition of the road. Secondary or unimproved roads in this area sometimes provide better supply routes than do improved roads. In many cases, roads are improved only where they
